SWI V2 ISO Claim-Gate: Public Review Package

Report and evidence summary for independent reviewers

Author: Ronald Mosidila, Founder / Director, Trusts Motion, Botswana
Date: Sunday, 1 November 2026

This is not an announcement of ISO certification. It is an invitation to examine the engineering, reproduce the reported results and identify what needs to improve.

1. Purpose and Scope

This report summarises a reproducibility and technical evidence package published for SWI V2 (Structured Workflow Intelligence). It states what was recorded, what has been checked, and what remains open. It makes no claim of ISO conformity, independent validation or production authorization.

1.1 Governing distinctions

- DATA is not EVIDENCE, which is not ADMISSION, which is not AUTHORIZATION, which is not ACTION.
- MATCH is not PERMIT, which is not EXECUTE.
- CI_GREEN is not SWI_AUTHORIZED.
- NAMED, IMPLEMENTED, TESTED, PROVEN, SEALED, AUTHORIZED and PRODUCTION AUTHORIZED are separate states.

2. Published Package

2.1 Locations and identifiers

Item	Value
Repository	https://github.com/Kelronmos/SWI-V2-Modules-11-22
Review branch	review/iso-gate-repro-2026-11-01
Base commit under test	`4f8685181d8c8af2166277262ecae30182c90cce`
Evidence commit	`24aad6fc42166abc33615f242b9f6bce1c3dae3d` (not independently checked by the preparer of this PDF)
Run timestamp (UTC)	2026-11-01T09:52:32Z, per test_results.json

2.2 Documents

- Reproducibility review report
- Recorded test results (JSON)
- Restoration verification (JSON)

The report also references command_log.txt, environment.json and BEFORE/AFTER hash lists under evidence/backup_restoration/.

3. Recorded Results

Verification activity	Recorded result
ISO claim-gate tests (tests/test_iso_claim_gate.py)	13 passed
Kernel subset (cek_alignment_monitor, law, pre_r)	536 passed
ISO claim-status validator	Exit code 0 (structural fallback; jsonschema not installed)
Critical-path restoration	7 paths matched
Full-tree backup completeness	Not established

3.1 Qualifications

- The validator used a structural fallback. This is not equivalent to full JSON Schema validation.
- Results come from the publication run. They have not been reproduced by an external reviewer.
- The archive is a critical-path archive, not a full-repository backup. A matching SHA-256 digest does not establish completeness.

4. Open Items and Status

Item	Position
DEF-ISO-002: licensed requirements and clause mapping	Open
DEF-ISO-003: durable replay and independent reproduction	Open
DEF-ISO-004: full JSON Schema validation in CI	Open
Independent third-party review	Pending
ISO conformity	Not established
Production authorization	No

The review branch has not been merged into main and should not be merged as proof of ISO conformity.

5. Preparer Verification Notes

5.1 Observed

- The report and test_results.json load on the review branch and agree on the base commit.
- test_results.json records 13 passed, 536 passed, validator exit code 0 and the structural-fallback note.
- The report states ISO conformity is not established and lists DEF-ISO-002, 003 and 004 as open.

5.2 Not verified

- The evidence commit hash, restore_verification.json, command_log.txt, environment.json and the archive SHA-256.
- The JSON Schema draft version cited in public text.

5.3 Wording points to resolve before publication

- The report line CONFORMITY_CLAIM = SEALED can be misread, because SEALED is also a rung on the maturity ladder. Add a clarifying line or reword.
- The figures 13 and 536 appear in test_results.json, not in the report text. Cite the JSON.

- Use "7 critical paths" (the report's wording) rather than "seven files".
- The report lists an AFTER SHA list, not an AFTER manifest. Avoid "BEFORE and AFTER manifests".

6. Standards Reference Points

SWI does not claim conformity to the standards below. They are context for judging whether SWI's claims are appropriately bounded. The repository's standards register defines which standards SWI actually maps, and the licensed mapping remains open (DEF-ISO-002).

- ISO/IEC 42001, AI management systems (ISO explainer) (link checked)
- ISO/IEC 42001 catalogue entry (from memory, confirm before use)
- ISO/IEC 23894, AI risk management (from memory, confirm before use)
- NIST AI Risk Management Framework (from memory, confirm before use)

7. Guidance for Independent Reviewers

7.1 Requested steps

1. Identify the exact commit reviewed.
2. Reproduce the relevant tests where possible, using the commands recorded in test_results.json.
3. Record the environment and commands used.
4. Document findings, limitations and defects.
5. Distinguish reproduced results from results that could not be reproduced.
6. Publish an attributable review and disclose conflicts of interest.

7.2 Reviewer profiles sought

Software assurance engineers, cybersecurity and systems assurance professionals, AI governance and risk specialists, ISO and standards practitioners, and academic researchers. Critical findings and disagreement are welcome. No reviewer will be represented as approving SWI without actual participation and attributable findings.

7.3 Reproduction commands recorded in test_results.json

```
python3 tools/validate_iso_claim_status.py evidence/iso_claim_status.json
python3 -m pytest tests/test_iso_claim_gate.py -q --tb=line
python3 -m pytest tests/cek_alignment_monitor tests/law tests/pre_r -q --tb=no
```

Dependency installation steps were not checked by the preparer.

8. Closing Statement

REPORTED is not INDEPENDENTLY VERIFIED. A BACKUP HASH MATCH is not FULL-TREE COMPLETENESS. A TEST PASS is not ISO CONFORMITY. Transparency is not a request for trust. It is an opportunity to verify.
